

option 1: horizontal stacking You have 1:34 remaining to play a word

← updating countdown
selectable and draggable tiles
Some kind of rack visual
with horizontal stacking, scoreboard looks kinda wack !!

Exchange All Tiles

Clear All

Done!

Scoreboard

forgets all tile and board selections made

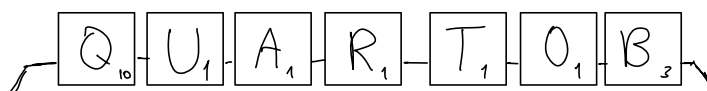

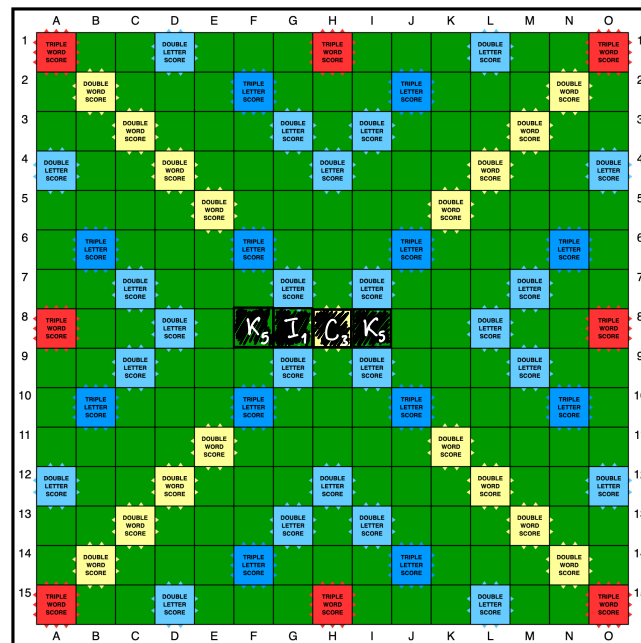

submit ur word (this acts as confirmation that player is good w what they've put down)

option 2: vertical stacking

You have 1:34 remaining to play a word

Scoreboard

Nitya	1000
Sammy	999
Anand	2

Exchange All Tiles

Clear All

Done!

im worried this vertical stacking will limit how big the board display can be (bc we need space for buttons + rack underneath) but this is kinda how both colonist.io and skribbl.io lay out their boards...

Notes

- on ur turn u select the order in which u want ur tiles to go on the board. Tap tile once to select, tap again to deselect. Once u select tiles, u select where on the board u want to put them. In implementation this can be structured as 2 ordered lists. Note: this is perhaps a little clunky in terms of UI but easy to code (i think). Open to suggestions for less UI-clunky implementations! 😊
- no built-in word validation; we will be discussing on Zoom
- i think i do want some basic validation just to ensure the played word isn't floating - an error message can pop up when they click the Done! button
- we could have some cool animation sequence that shows the point calculations - this would simulate real-world delay, which gives other players the time to decide if they want to challenge
- I would LOVE for some way to easily rearrange the tiles on the rack - drag and drop perhaps? If I pick up a tile (different from selecting) and hover it between 2 other tiles on the rack, those two tiles should separate to leave enough space for my hovering tile to drop in between when i let go. Naturally, it would follow that if I pick up a tile and hover it in front of / behind the first/last tile it should become the new first/last tile.

I have no idea how to implement this UI Imao. And again, very much open to suggestions for improvement!

- Upon timer running out, the game should play whatever selection the player has made. If they haven't selected anything, then too bad (womp womp ☹️). Perhaps we can make it clear to all players that they should just have something chosen and then they can use their remaining time to try to think. When they have a better selection, they can click the Clear All button then make their new selection. And as long as they have time remaining, they can repeat as many times as they'd like.
